

Task 01

Network Scanning & Reconnaissance Report

Introduction

This report documents a network scan performed using Nmap to identify open ports, services, and potential security risks. The scan was conducted on a local network using the command: `nmap -A 10.105.x.x.x`. Nmap helps organizations improve network security by identifying exposed services and vulnerable systems.

Tools Used

- Nmap (Network Mapper)
- Operating System: Windows

Findings

Active Host: 10.105.x.x.x

Open Ports:

- 135 (MSRPC)
- 139 (NetBIOS)
- 445 (SMB)
- 16992 (Intel AMT)
- 7070 (Unknown Service)

Risk Analysis

Port 135: Remote procedure call risks.

Port 139: NetBIOS exposure.

Port 445: Vulnerable to SMB attacks.

Port 16992: Remote management risk.

Port 7070: Unknown service risk.

Recommendations

- Disable unused ports
- Enable firewall protection
- Keep system updated
- Use secure protocols

Scan Results Explanation

The scan detected:

- One Active host
- Multiple open ports
- Windows related services

Learning Outcome

Through this task, the following concepts were understood:

- Basics of network reconnaissance
- Use of Nmap scanning commands
- Identification of open ports and services
- Understanding of common network vulnerabilities
- Importance of network security and port management

Conclusion

The scan identified several open ports that may pose security risks. Proper configuration and security measures are recommended. The scan helped understand how network reconnaissance is performed and how exposed services can create security risks. Proper security practices, and regular updates are important for maintaining network security.

Output
